

Flat Roof Leak Repair

Flat Roof In Minneapolis Leaked for Years and Copper Was the Answer

The Problem

Perhaps you have heard it before. There are two types of flat roofs: Those that are leaking and those that are about to leak. In fairness to flat roofs, the reality is that there is no truly permanent roof. When flat roofs fail they usually have more dramatic and immediate problems (rot, mold, collapsed ceilings, etc.). The project featured in this Case Study was no exception.

The demands placed on flat roofs in Minneapolis create a unique set of challenges to even the most robust systems. The flat roof here was a 10 year old rubber membrane roof (aka, EPDM). Over the past few years as the leaks got worse and worse our client had a few contractors attempt to fix the problem. By the time we arrived it was clearly a case where total replacement was warranted.

The Solution

As with most residential construction challenges, proper diagnosis of the problem is the best place to start. We used our thermal imager after a long rain storm to look into the ceiling. The resulting images indicated three separate leaks, confirming the idea that roof replacement was smarter than repair.

We gave our client two material options including TPO membrane and copper. They choose copper because this roof was visible from the master suite and they wanted a touch of architectural character. Years later the roof is still leak free.

Roof two months after completion. It will have a consistent brown patina within one year.
